FIELD OF THE INVENTION

[0003] The invention provides compositions and methods for producing purified oligosaccharides, in particular certain fucosylated and/or sialylated oligosaccharides that are typically found in human milk.

BACKGROUND OF THE INVENTION

[0004] Human milk contains a diverse and abundant set of neutral and acidic oligosaccharides (human milk oligosaccharides, HMOS). Many of these molecules are not utilized directly by infants for nutrition, but they nevertheless serve critical roles in the establishment of a healthy gut microbiome, in the prevention of disease, and in immune function. Prior to the invention described herein, the ability to produce HMOS inexpensively at large scale was problematic. For example, HMOS production through chemical synthesis was limited by stereo-specificity issues, precursor availability, product impurities, and high overall cost. As such, there is a pressing need for new strategies to inexpensively manufacture large quantities of HMOS for a variety of commercial applications.

SUMMARY OF THE INVENTION

[0005] The invention described herein features efficient and economical methods for producing fucosylated and sialylated oligosaccharides. The method for producing a fucosylated oligosaccharide in a bacterium comprises the following steps: providing a bacterium that comprises a functional β -galactosidase gene, an exogenous fucosyltransferase gene, a GDP-fucose synthesis pathway, and a functional lactose permease gene; culturing the bacterium in the presence of lactose; and retrieving a fucosylated oligosaccharide from the bacterium or from a culture supernatant of the bacterium.

[0006] To produce a fucosylated oligosaccharide by biosynthesis, the bacterium utilizes an endogenous or exogenous guanosine diphosphate (GDP)-fucose synthesis pathway. By "GDP-fucose synthesis pathway" is meant a sequence of reactions, usually controlled and catalyzed by

enzymes, which results in the synthesis of GDP-fucose. An exemplary GDP-fucose synthesis pathway in *Escherichia coli* is set forth below. In the GDP-fucose synthesis pathway set forth below, the enzymes for GDP-fucose synthesis include: 1) manA=phosphomannose isomerase (PMI), 2) manB=phosphomannomutase (PMM), 3) manC=mannose-1-phosphate guanylyltransferase (GMP), 4) gmd=GDP-mannose-4,6-dehydratase (GMD), 5) fcl=GDP-fucose synthase (GFS), and 6) ΔwcaJ=mutated UDP-glucose lipid carrier transferase.

Glucose \rightarrow Glc-6-P \rightarrow Fru-6-P \rightarrow ¹ Man-6-P \rightarrow ² Man-1-P \rightarrow ³ GDP-Man \rightarrow ^{4,5} GDP-Fuc \rightarrow ⁶ Colanic acid.

[0007] The synthetic pathway from fructose-6-phosphate, a common metabolic intermediate of all organisms, to GDP-fucose consists of 5 enzymatic steps: 1) PMI (phosphomannose isomerase), 2) PMM (phosphomannomutase), 3) GMP (mannose-1-phosphate guanylyltransferase), 4) GMD (GDP-mannose-4,6-dehydratase), and 5) GFS (GDPfucose synthase). Individual bacterial species possess different inherent capabilities with respect to GDP-fucose synthesis. Escherichia coli, for example, contains enzymes competent to perform all five steps, whereas Bacillus licheniformis is missing enzymes capable of performing steps 4 and 5 (i.e., GMD and GFS). Any enzymes in the GDP-synthesis pathway that are inherently missing in any particular bacterial species are provided as genes on recombinant DNA constructs, supplied either on a plasmid expression vector or as exogenous genes integrated into the host chromosome.

[0008] The invention described herein details the manipulation of genes and pathways within bacteria such as the enterobacterium Escherichia coli K12 (E. coli) or probiotic bacteria leading to high level synthesis of HMOS. A variety of bacterial species may be used in the oligosaccharide biosynthesis methods, for example Erwinia herbicola (Pantoea agglomerans), Citrobacter freundii, Pantoea citrea, Pectobacterium carotovorum, or Xanthomonas campestris. Bacteria of the genus Bacillus may also be used, including Bacillus subtilis, Bacillus licheniformis, Bacillus coagulans, Bacillus thermophilus, Bacillus laterosporus, Bacillus megaterium, Bacillus mycoides, Bacillus pumilus, Bacillus lentus, Bacillus cereus, and Bacillus circulans. Similarly, bacteria of the genera Lactobacillus and Lactococcus may be modified using the methods of this invention, including but not limited to Lactobacillus acidophilus, Lactobacillus salivarius, Lactobacillus plantarum, Lactobacillus helveticus, Lactobacillus delbrueckii, Lactobacillus rhamnosus, Lactobacillus bulgaricus, Lactobacillus crispatus, Lactobacillus gasseri, Lactobacillus casei, Lactobacillus reuteri, Lactobacillus jensenii, and Lactococcus lactis. Streptococcus thermophiles and Proprionibacterium freudenreichii are also suitable bacterial species for the invention described herein. Also included as part of this invention are strains, modified as described here, from the genera Enterococcus (e.g., Enterococcus faecium and Enterococcus thermophiles), Bifidobacterium (e.g., Bifidobacterium longum, Bifidobacterium infantis, and Bifidobacterium bifidum), Sporolactobacillus spp., Micromomospora spp., Micrococcus spp., Rhodococcus spp., and Pseudomonas (e.g., Pseudomonas fluorescens and Pseudomonas aeruginosa). Bacteria comprising the characteristics described herein are cultured in the presence of lactose, and a fucosylated oligosaccharide is retrieved, either from the bacterium itself or from a culture supernatant of the bacterium. The fucosylated oligosaccha-
